

Linking Lines

Oleg Viro

November 2, 2006

Can lines be linked?

- Can lines be linked?

- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

Is it possible to **weave** together disjoint lines?

Can lines be linked?

- Can lines be linked?

- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines

Amphicheiral and Nonamphicheiral

Is it possible to **weave** together disjoint lines?

At first glance this may seem **not** to be possible.

Yet where do we get this impression? In daily life we never come across anything that really resembles a straight line. Any set of disjoint **line segments** can be moved around to any other relative location in such a way that they remain disjoint. Thus, **disjoint line segments cannot be linked.**

Can a set of disjoint lines be *rearranged*

by a continuous movement during which they stay disjoint?

Any two sets of parallel lines with the same number of lines in each set **can be transformed to each other** in this sense.

Combing lines

- Can lines be linked?
- **Combing lines**
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

Can an arbitrary set of lines be moved (“combed”) into a set of parallel lines?

Combing lines

- Can lines be linked?
- **Combing lines**
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

Choose two parallel planes which are not parallel to any of the lines in our set.

Combing lines

- Can lines be linked?
- **Combing lines**
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

Choose two parallel planes which are not parallel to any of the lines in our set.

Fix the points of intersection of the first plane with the lines, by fastening the lines at those points.

Combing lines

- Can lines be linked?
- **Combing lines**
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

Choose two parallel planes which are not parallel to any of the lines in our set.

Fix the points of intersection of the first plane with the lines.
Also fix the intersection of the lines with the second plane.

Combing lines

- Can lines be linked?
- **Combing lines**
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

Choose two parallel planes which are not parallel to any of the lines in our set.

Fix the points of intersection of the first plane with the lines. Also fix the intersection of the lines with the second plane, but only as a point on that plane, which we allow to slide along the lines.

Combing lines

- Can lines be linked?
- **Combing lines**
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

Choose two parallel planes which are not parallel to any of the lines in our set.

Fix the points of intersection of the first plane with the lines.

Also fix the intersection of the lines with the second plane.

In other words, drill small holes in the second plane where it intersects with the lines.

Combing lines

- Can lines be linked?
- **Combing lines**
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

Choose two parallel planes which are not parallel to any of the lines in our set.

Fix the points of intersection of the first plane with the lines.

Also fix the intersection of the lines with the second plane

Move the second plane away from the first one in the direction perpendicular to both planes.

Combing lines

- Can lines be linked?
- **Combing lines**
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

Choose two parallel planes which are not parallel to any of the lines in our set.

Fix the points of intersection of the first plane with the lines.

Also fix the intersection of the lines with the second plane

Move the second plane away from the first one in the direction perpendicular to both planes.

The lines are pulled through the holes

Combing lines

- Can lines be linked?
- **Combing lines**
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

Choose two parallel planes which are not parallel to any of the lines in our set.

Fix the points of intersection of the first plane with the lines.

Also fix the intersection of the lines with the second plane

Move the second plane away from the first one in the direction perpendicular to both planes.

The lines are pulled through the holes, their angles with the planes increase.

Combing lines

- Can lines be linked?
- **Combing lines**
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

Choose two parallel planes which are not parallel to any of the lines in our set.

Fix the points of intersection of the first plane with the lines.

Also fix the intersection of the lines with the second plane

Move the second plane away from the first one in the direction perpendicular to both planes.

The lines are pulled through the holes, their angles with the planes increase.

Move the second plane to infinity in a finite amount of time, then these angles all reach 90° , i.e., the lines become parallel to one another.

Combing lines

- Can lines be linked?
- **Combing lines**
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

Choose two parallel planes which are not parallel to any of the lines in our set.

Fix the points of intersection of the first plane with the lines.

Also fix the intersection of the lines with the second plane

Move the second plane away from the first one in the direction perpendicular to both planes.

The lines are pulled through the holes, their angles with the planes increase.

Move the second plane to infinity in a finite amount of time, then these angles all reach 90° , i.e., the lines become parallel to one another.

Another description: expand the space away from the first plane in a direction perpendicular to it, driving the expansion factor rapidly to infinity in a finite length of time.

Combing lines

- Can lines be linked?
- **Combing lines**
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

Choose two parallel planes which are not parallel to any of the lines in our set.

Fix the points of intersection of the first plane with the lines.

Also fix the intersection of the lines with the second plane

Move the second plane away from the first one in the direction perpendicular to both planes.

The lines are pulled through the holes, their angles with the planes increase.

Move the second plane to infinity in a finite amount of time, then these angles all reach 90° , i.e., the lines become parallel to one another.

Another description: expand the space away from the first plane in a direction perpendicular to it, driving the expansion factor rapidly to infinity in a finite length of time. The lines rotate around their points of intersection with the first plane, and in the limit become perpendicular to the planes.

No parallel lines

- Can lines be linked?
- Combing lines
- **No parallel lines**
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

Thus, one cannot link disjoint lines:

all sets of disjoint lines are arranged in the same way.

No parallel lines

- Can lines be linked?
- Combing lines
- **No parallel lines**
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

Thus, one cannot link disjoint lines:

all sets of disjoint lines are arranged in the same way.

However, there are serious **reasons for disqualifying** this result.

No parallel lines

- Can lines be linked?
- Combing lines
- **No parallel lines**
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

Thus, one cannot link disjoint lines:

all sets of disjoint lines are arranged in the same way.

However, there are serious **reasons for disqualifying** this result.

First, it was too easy.

No parallel lines

- Can lines be linked?
- Combing lines
- **No parallel lines**

Second, parallel lines are very **close** to being intersecting: one can rotate one of two parallel lines by an arbitrarily small angle to make them intersect. This is **not** the case for skew lines.

Third, parallel lines intersect in the **projective space**.

Let us decide **not to allow parallel lines anymore!**

Equivalence of links made of skew lines

- Can lines be linked?
- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

We say that the linking of a set of lines *remains the same* if it is moved in such a way that the lines are always skew, never intersect and never parallel.

Equivalence of links made of skew lines

- Can lines be linked?
- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and Nonamphicheiral

We say that the linking of a set of lines *remains the same* if it is moved in such a way that the lines are always skew. Such movements of lines is called an *isotopy*.

Equivalence of links made of skew lines

- Can lines be linked?
- Combing lines
- No parallel lines
- **Equivalence of links made of skew lines**
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

We say that the linking of a set of lines *remains the same* if it is moved in such a way that the lines are always skew. Such movements of lines is called an *isotopy*. If one set of lines can be obtained from another by an isotopy, then the two sets are *isotopic*.

Pair of lines

- Can lines be linked?
- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- **Pair of lines**
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

Theorem. *Any two pairs of skew lines are isotopic.*

Pair of lines

The linking number is $+1$ if the lines look like this:

the linking number is -1 if the lines look like that:

Changing the orientation of **one** of the lines of the pair **changes the linking number**. If the orientation of the pair reverses

Linking number

- Can lines be linked?
- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- **Linking number**
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and Nonamphicheiral

An oriented pair of lines has a characteristic which takes the value $+1$ or -1 . It is called the *linking number*.

The linking number is preserved under isotopies, and so if two oriented pairs of lines have different linking numbers, then they are not isotopic.

The linking number is $+1$ if the lines look like this:

the linking number is -1 if the lines look like that:

Changing the orientation of **one** of the lines of the pair **changes the linking number**. If the orientation of the pair reverses (i.e., the orientation reverses on both lines)

Linking number

- Can lines be linked?
- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- **Linking number**
- Triples of lines

- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and Nonamphicheiral

Consider an arbitrary triple of pairwise skew lines which do not lie in three parallel planes.

For each line draw two planes containing the line, each parallel to one of the other two lines.

Overall six planes, i.e., three pairs of parallel planes.

These planes form a parallelepiped.

Our lines are the extensions of three of its skew edges:

Parallelepiped

- Can lines be linked?
- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- **Parallelepiped**
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

Any three pair-wise skew lines which do not lie in three parallel planes are extensions of the edges of a parallelepiped.

Parallelepiped

- Can lines be linked?
- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- **Parallelepiped**
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

Any three pair-wise skew lines which do not lie in three parallel planes are extensions of the edges of a parallelepiped.

Parallelepiped

- Can lines be linked?
- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- **Parallelepiped**
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and Nonamphicheiral

Any three pair-wise skew lines which do not lie in three parallel planes are extensions of the edges of a parallelepiped.

This parallelepiped is the first object which we associate to the triple of lines.

Parallelepiped

- Can lines be linked?
- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- **Parallelepiped**
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and Nonamphicheiral

Any three pair-wise skew lines which do not lie in three parallel planes are extensions of the edges of a parallelepiped.

This parallelepiped is the first object which we associate to the triple of lines. **What is special about it?**

Parallelepiped

- Can lines be linked?
- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- **Parallelepiped**
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and Nonamphicheiral

Any three pair-wise skew lines which do not lie in three parallel planes are extensions of the edges of a parallelepiped.

This parallelepiped is unique.

Parallelepiped

- Can lines be linked?
- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- **Parallelepiped**
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and Nonamphicheiral

Any three pair-wise skew lines which do not lie in three parallel planes are extensions of the edges of a parallelepiped.

This parallelepiped is unique.

Indeed, there is a unique plane parallel to a given line that contains a second skew line.

Parallelepiped

- Can lines be linked?
- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- **Parallelepiped**
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and Nonamphicheiral

Any three pair-wise skew lines which do not lie in three parallel planes are extensions of the edges of a parallelepiped.

This parallelepiped is unique.

Indeed, there is a unique plane parallel to a given line that contains a second skew line.

Hence, the six planes are uniquely determined by the original triple of lines.

Deforming parallelipiped

- Can lines be linked?
- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelipiped
- **Deforming parallelipiped**
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

A parallelepiped is determined (up to isometry) by the lengths of its edges and the angles.

Deforming parallelepiped

- Can lines be linked?
- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

A parallelepiped is determined (up to isometry) by the lengths of its edges and the angles. By a continuous deformation, make all of the angles into right angles (obtaining a rectangular parallelepiped),

Deforming parallelipiped

- Can lines be linked?
- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelipiped
- **Deforming parallelipiped**
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

A parallelepiped is determined (up to isometry) by the lengths of its edges and the angles. By a continuous deformation, make all of the angles into right angles, then make the length of all edges equal to one (obtaining a cube).

Deforming parallelepiped

- Can lines be linked?
- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- **Deforming parallelepiped**
- Linking number of a triple

Amphicheiral and Nonamphicheiral

A parallelepiped is determined (up to isometry) by the lengths of its edges and the angles. By a continuous deformation, make all of the angles into right angles, then make the length of all edges equal to one

Deforming parallelepiped

- Can lines be linked?
- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- **Deforming parallelepiped**
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

A parallelepiped is determined (up to isometry) by the lengths of its edges and the angles. By a continuous deformation, make all of the angles into right angles, then make the length of all edges equal to one

This induces an isotopy of the triple of lines.

Deforming parallelepiped

- Can lines be linked?
- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- Deforming parallelepiped
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

A parallelepiped is determined (up to isometry) by the lengths of its edges and the angles. By a continuous deformation, make all of the angles into right angles, then make the length of all edges equal to one

This induces an isotopy of the triple of lines.

The lines have been placed along pairwise skew edges of a unit cube.

Deforming parallelepiped

- Can lines be linked?
- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- **Deforming parallelepiped**
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

A parallelepiped is determined (up to isometry) by the lengths of its edges and the angles. By a continuous deformation, make all of the angles into right angles, then make the length of all edges equal to one

This induces an isotopy of the triple of lines.

The lines have been placed along pairwise skew edges of a unit cube. By a rotation of the cube, one can take any edge of the cube to any other edge.

Deforming parallelepiped

- Can lines be linked?
- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- **Deforming parallelepiped**
- Linking number of a triple

Amphicheiral and
Nonamphicheiral

A parallelepiped is determined (up to isometry) by the lengths of its edges and the angles. By a continuous deformation, make all of the angles into right angles, then make the length of all edges equal to one

This induces an isotopy of the triple of lines.

The lines have been placed along pairwise skew edges of a unit cube. By a rotation of the cube, one can take any edge of the cube to any other edge.

This reduces the number of possible nonisotopic configurations to two.

Deforming parallelepiped

- Can lines be linked?
- Combing lines
- No parallel lines
- Equivalence of links made of skew lines
- Pair of lines
- Orientations and Semi-Orientations
- Linking number
- Triples of lines
- Parallelepiped
- **Deforming parallelepiped**
- Linking number of a triple

Amphicheiral and Nonamphicheiral

A parallelepiped is determined (up to isometry) by the lengths of its edges and the angles. By a continuous deformation, make all of the angles into right angles, then make the length of all edges equal to one

This induces an isotopy of the triple of lines.

The lines have been placed along pairwise skew edges of a unit cube. By a rotation of the cube, one can take any edge of the cube to any other edge.

This reduces the number of possible nonisotopic configurations to two.

Links of four lines:

Theorem. Any link of four lines is isotopic to one of these links.

Proof. Take an arbitrary link of four lines. The fourth line:

1. either does not intersect the hyperboloid
2. or intersect it in a single point,
3. or intersect it in two points,

Four lines

Links of four lines:

Theorem. Any link of four lines is isotopic to one of these links.

Proof. Take an arbitrary link of four lines. The fourth line:

1. either does not intersect the hyperboloid
2. or intersect it in a single point,
3. or intersect it in two points,
4. or lies on the hyperboloid.

Links of four lines:

Theorem. Any link of four lines is isotopic to one of these links.

Proof. Take an arbitrary link of four lines. The fourth line:

1. either does not intersect the hyperboloid
2. or intersect it in a single point,
3. or intersect it in two points,
4. or lies on the hyperboloid.

In the last case the link is isotopic either to the left or the center link.

Links of four lines:

Theorem. Any link of four lines is isotopic to one of these links.

Proof. Take an arbitrary link of four lines. The fourth line:

1. either does not intersect the hyperboloid
2. or intersect it in a single point,
3. or intersect it in two points,

If the fourth line does not intersect the hyperboloid, then it can be brought in toward the hyperboloid until it is tangent to the hyperboloid, i.e., the case 1 is reduced to case 2.

Four lines

- Can lines be linked?
- Combing lines

Links of four lines:

Theorem. Any link of four lines is isotopic to one of these links.

Proof. Take an arbitrary link of four lines. The fourth line:
3. or intersect it in two points,

If the fourth line intersects the hyperboloid in two points, then everything depends on whether these points are in the same part of the hyperboloid into which the first three lines divide it, or are in different parts (the hyperboloid is divided into three sections).

Links of four lines:

Theorem. Any link of four lines is isotopic to one of these links.

Proof. Take an arbitrary link of four lines. The fourth line:

3. or intersect it in two points,

If the points are in the same part, then the fourth line can be placed on the hyperboloid without the first three lines interfering.

Four lines

Links of four lines:

Theorem. Any link of four lines is isotopic to one of these links.

Proof. Take an arbitrary link of four lines. The fourth line:
3. or intersect it in two points,

If the points are in the same part, then the fourth line can be placed on the hyperboloid without the first three lines interfering. Then the fourth line becomes a generatrix, and we are in case 4.

Four lines

Links of four lines:

Theorem. Any link of four lines is isotopic to one of these links.

Proof. Take an arbitrary link of four lines. The fourth line:

3. or intersect it in two points,

If the fourth line intersects the hyperboloid in different parts, then the link is isotopic to the rightmost one.

Five lines
