Abelian and nilpotent regular maps and dessins

Original results on the nilpotent maps were done in collaboration with **M. Conder, S.F. Du, A. Malnič and M. Škoviera.**

Original results on the nilpotent dessins come from the thesis of my former PhD. student **Naer Wang** defended on May, 29, 2014 and from subsequent papers in progress by **Kan Hu, Naer Wang** and N.

Abelian and nilpotent regular maps and dessins

Maps and Combinatorial Maps

Topological map A 2-cell decomposition of a surface = 2-cell embedding of a connected graph into a surface,

Surfaces preferably compact connected and orientable and their universal covers,

Combinatorial Map Equivalence classes of topological maps up to isotopy can be described by triples $(D; R, L)$

D a set of darts, L is an (dart-reversing) involution, R rotation system,

Category of Ormaps Combinatorial maps and their homomorphisms,

Vertices, Edges and Faces Orbits of R, L, and RL,

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Regular maps

Monodromy group is the group $\langle R, L \rangle$, by definition it is transitive on the set D of darts,

Automorphism group permutations in $Sym(D)$ centralising the monodromy group form the automorphism group $Aut(M)$ of a map M,

semiregularity $Aut(M)$ is semiregular on D;

regularity if $Aut(M)$ is regular on D, then M is called regular; in a regular map $Aut(M) \cong Mon(M)$ and $|D| = |Aut(M)| = |Mon(M)|$;

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Abelian and Nilpotent maps

A regular map with an (abelian) nilpotent automorphism group will be called an **(abelian) nilpotent map**,

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Abelian and Nilpotent maps

A regular map with an (abelian) nilpotent automorphism group will be called an **(abelian) nilpotent map**,

A (abelian) nilpotent map can be view as a triple $(G; x, y)$, where $G = \langle x, y \rangle$ is an (abelian) nilpotent group, $y^2 = 1$,

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Abelian and Nilpotent maps

A regular map with an (abelian) nilpotent automorphism group will be called an **(abelian) nilpotent map**,

A (abelian) nilpotent map can be view as a triple $(G; x, y)$, where $G = \langle x, y \rangle$ is an (abelian) nilpotent group, $y^2 = 1$,

Two such maps (triples) are **equivalent** if there the assignment $x_1 \mapsto x_2$ and $y_1 \mapsto y_2$ extends to a group isomorphism,

Abelian and nilpotent regular maps and dessins

General problem: Characterisation (classification) of nilpotent maps.

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Problem(s) considered

General problem: Characterisation (classification) of nilpotent maps.

More realistic problems: Investigate invariants: nilpotency **class, type, structure of underlying graphs, chirality/reflexibility, classification of particular subclasses,**

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Problem(s) considered

General problem: Characterisation (classification) of nilpotent maps.

More realistic problems: Investigate invariants: nilpotency **class, type, structure of underlying graphs, chirality/reflexibility, classification of particular subclasses,**

In general, we want to understant what are the most important invariants of nilpotent maps,

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Problem(s) considered

General problem: Characterisation (classification) of nilpotent maps.

More realistic problems: Investigate invariants: nilpotency **class, type, structure of underlying graphs, chirality/reflexibility, classification of particular subclasses,**

In general, we want to understand what are the most important invariants of nilpotent maps,

Since **non-abelian nilpotent maps are bipartite,** some of the ideas naturally generalise to **nilpotent regular hypermaps and dessins.**

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Abelian regular maps, an easy exercise

Theorem

A folklore result: Abelian regular maps are the semistars, balanced regular embeddings of bouquets of loops and embeddings of n-dipoles with exponent 1.

An argument: the group is either cyclic, or $Z_2 \times Z_n$, check how one can generate them by an involution and a non-involution.

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Examples of nilpotent maps

① Cycles of length n, $n = 2^m$, and their duals, of nilpotency class m

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Examples of nilpotent maps

1. Cycles of length n, $n = 2^m$, and their duals, of nilpotency class m

2. Regular embeddings of cycles of length $n = 2^m$ and multiplicity 2^k

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Examples of nilpotent maps

1. Cycles of length n, $n = 2^m$, and their duals, of nilpotency class m

2. Regular embeddings of cycles of length $n = 2^m$ and multiplicity 2^k

3. Du, Jones, Kwak, Nedela, Skoviera (2007, 2010, 2013): Regular embeddings of $K_{n,n}$, where $n = 2^m$, there are 2^{m-2} of them with the metacyclic colour preserving group and four with the non-metacyclic subgroup.

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Conclusion: **Nilpotent maps form a complex family of maps**

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Basic facts on the nilpotent maps

Theorem (Malnic, N., Škoviera)

A nilpotent map $(G; x, y)$ decomposes into S. Wilson's product:
$G_2 \times Ss_m$, where $G_2 = \langle x_2, y_2 \rangle$ is the Sylow 2-group and Ss_m is an
odd semistar,

Corollary

The automorphism group of a nilpotent map with a simple
underlying graph is a 2-group.

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Nilpotent maps of class two

Theorem (Malnic, N., Škoviera EJC 2012)

Every nilpotent map of class two belong to one of the two families defined by presentations:

$$G_1(n) = \langle x, y | x^{2^n} = y^2 = 1, [x, y] = x^{2^{n-1}} \rangle, n \geq 2$$

and

$$G_2(n) = \langle x, y, z | x^{2^n} = y^2 = z^2 = [x, z] = [y, z] = 1, z = [x, y] \rangle.$$

Abelian and nilpotent regular maps and dessins

Universal map of class c

$\Gamma = C * C_2 \cong \langle x, y | y^2 = 1 \rangle$, (the universal map)

Set $\Gamma_1 = [\Gamma, \Gamma]$ and in general $\Gamma_{n+1} = [\Gamma, \Gamma_n]$.

Then the universal map of class c is

$$H(c) = \Gamma/\Gamma_c \cong \langle \bar{x}, \bar{y} \rangle,$$

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Universal map of class c

$\Gamma = C * C_2 \cong \langle x, y | y^2 = 1 \rangle$, (the universal map)

Set $\Gamma_1 = [\Gamma, \Gamma]$ and in general $\Gamma_{n+1} = [\Gamma, \Gamma_n]$.

Then the universal map of class c is

$$H(c) = \Gamma/\Gamma_c \cong \langle \bar{x}, \bar{y} \rangle,$$

it is an infitite group, but for small $c \leq 3$ we observed that nilpotent maps tend to have parallel edges.

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Universal map of class c

$\Gamma = C * C_2 \cong \langle x, y | y^2 = 1 \rangle$, (the universal map)

Set $\Gamma_1 = [\Gamma, \Gamma]$ and in general $\Gamma_{n+1} = [\Gamma, \Gamma_n]$.

Then the universal map of class c is

$$H(c) = \Gamma/\Gamma_c \cong \langle \bar{x}, \bar{y} \rangle,$$

it is an infitite group, but for small $c \leq 3$ we observed that nilpotent maps tend to have parallel edges.

Conjecture: there are just finitely many nilpotent maps of bounded class without parallel edges.

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

The number of vertices of the universal map?

Group theoretical formulation:
Determine the size of $U(c) = H(c)/core(\bar{x})$.

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

The number of vertices of the universal map?

Group theoretical formulation:
Determine the size of $U(c) = H(c)/core(\bar{x})$.

Surprise: $U(c)$ is finite!!!

A recent result by Conder, Du, N., Škoviera: we determined a precise formula for the size of $|U(c)|$, its number of vertices, its type and genus.

Abelian and nilpotent regular maps and dessins

Three integer sequences

Set $h_1 = 0$, and then for $n \geq 2$ take

$$h_n = \frac{1}{n} \sum_{d|n} \mu(n/d) \Big(\sum_{0 \leq i \leq d/3} (-1)^i \frac{d}{d-2i} \binom{d-2i}{i} 2^{d-3i} \Big),$$

$$g_n = h_1 + h_2 + \cdots + h_n = \sum_{j=1}^{n} h_n,$$

$$f_n = g_1 + g_2 + \cdots + g_n = \sum_{i=1}^{n} g_n.$$

As usual, $\mu(m)$ denotes the Möbius function.

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

The number of vertices of the universal map of class c

Theorem (Labute77)

The rank of the factor group Γ_{n-1}/Γ_n is g_n, for all $n \geq 2$.

Theorem (Conder, Du, N.,Škoviera, 2014...)

For every integer $c \geq 1$ there exists a unique nilpotent regular map $\mathcal{U}_c$ of class c with simple underlying graph, having 2^{1+f_c} vertices, and type $\{2^c, 2^{c-1}\}_{2^c}$.

Furthermore, this map is 'universal', in the sense that every nilpotent regular map of class at most c with simple underlying graph is a quotient of $\mathcal{U}_c$.

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Just add relation $x^{c-1} = 1$ to the presentation of $H(c)$, since $core(x) = \langle x^{c-1} \rangle$ and identify all the normal subgroups.
Example: There are 21 nilpotent maps of class c, $2 \leq c \leq 4$, with a simple underlying graph.

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Generation of simple universal maps of given class

Just add relation $x^{c-1} = 1$ to the presentation of $H(c)$, since $core(x) = \langle x^{c-1} \rangle$ and identify all the normal subgroups.

Example: There are 21 nilpotent maps of class c, $2 \leq c \leq 4$, with a simple underlying graph.

M2.8.1	$[x^2, y^2, (xy)^4]$,
M3.64.1	$[x^4, y^2, x^{-1}yx^{-2}yxyx^2y, (x^{-1}y)^4(xy)^4]$,
M3.32.1	$[x^4, y^2, (x^{-1}y)^4, (xyx^{-1}y)^2]$
M3.32.2	$[x^4, y^2, x^{-1}yx^{-1}yxyxy]$
M3.16.1	$[x^2, y^2, (xy)^8]$

Roman Nedela

Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Generation of simple universal maps of given class

Just add relation $x^{c-1} = 1$ to the presentation of $H(c)$, since $core(x) = \langle x^{c-1} \rangle$ and identify all the normal subgroups.

Example: There are 21 nilpotent maps of class c, $2 \leq c \leq 4$, with a simple underlying graph.

M2.8.1 $[x^2, y^2, (xy)^4]$,
M3.64.1 $[x^4, y^2, x^{-1}yx^{-2}yxyx^2y, (x^{-1}y)^4(xy)^4]$,

We have a relation $yx^{2^t}y = x^{e2^t}$, where $k = 2^t$ and $m = 2^s$.

Since $e^2 = 1 \bmod m$, only four values $e = \pm 1$ and $e = 2^{s-1} \pm 1$ are admissible.

Example: Consider a familily of regular embeddings of $C_n^{(m)}$, where both n, m are powers of two. By the classification (Hu, N., Škoviera and Wang) for each fixed $n \geq 4$ and m there are exactly 8 such maps:

$$G(n, m; e, f) = \langle x, y \mid x^{2m} = y^2 = 1, y^{-1}x^2y = (x^2)^e, (xy)^n = (x^2)^f \rangle,$$

where $e^2 = 1 \bmod m$ and $f = \frac{1}{4}(e+1)n$ or $f = \frac{1}{4}((e+1)n + 2m)$.

Abelian and nilpotent regular maps and dessins

Maximal discrete actions of genus g

Let $\lambda(g)$ denote the order of a largest group of conformal automorphisms of a compact Riemann surface of genus g. Accola (1968) and MacLachlan (1969) independently proved that

$$8(g+1) \leq \lambda(g) \leq 84(g-1)$$

for $g \geq 2$ and there are infinitely many integers $g \geq 2$ for which the equality $\lambda(g) = 8(g+1)$ holds.

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Maximal nilpotent actions of genus g

If we take $n = 4$, $e = -1$, and $f = 0$, we get that the genus of $\mathcal{C}(4, m; -1, 0)$ is $g = m - 1$ with the automorphism group G of order $|G| = 8(g + 1)$, the lower bound of $\lambda(g)$.
The same problem for nilpotent groups has a solution

$$8(g + 1) \leq \lambda_{nil}(g) \leq 16(g - 1),$$

see Zamarrodian 1985, both extremal maps come from 2-groups.

Abelian and nilpotent regular maps and dessins

Representation of regular dessins

If D is regular, then we can label the edges of D by the elements of $G = Aut(D)$. Let $\langle x \rangle$ and $\langle y \rangle$ be generators of the stabilisers of two adjacent vertices (one is black the other is white). Hence we have an associated triple $(G; x, y)$, where $G = \langle x, y \rangle$.

Representation of regular dessins

If D is regular, then we can label the edges of D by the elements of $G = Aut(D)$. Let $\langle x \rangle$ and $\langle y \rangle$ be generators of the stabilisers of two adjacent vertices (one is black the other is white). Hence we have an associated triple $(G; x, y)$, where $G = \langle x, y \rangle$.

Vice-versa, given $(G; x, y)$ we set $E = G$, define the black vertices to be the (right) cosets of $\langle x \rangle$ and white vertices to be the cosets of $\langle y \rangle$. The edge-vertex incidence is given by the containment relation.

Abelian and nilpotent regular maps and dessins

Nilpotent maps versus nilpotent dessins

Theorem

A nilpotent non-abelian map determines a nilpotent dessin.

Vice-versa it is not true. So, nilpotent dessins form a broader family of structures.

Decomposition theorem for nilpotent dessins

Theorem (Decomposition Theorem)

Let $G \cong \prod_{i=1}^{k} G_i$ be the direct product decomposition of a finite two-generated nilpotent group G where G_i are the Sylow p_i-subgroups of G.

Then a regular dessin $D = (G, x, y)$ is the parallel product of regular dessins $D_i = (G_i, x_i, y_i)$ where x_i and y_i are the images of x and y under the natural projections $\pi_i : G \to G_i$.

Conclusion: It is sufficient to restrict investigation to p-**dessins.**

Abelian and nilpotent regular maps and dessins

Matej Bel University/Math. Inst. Slovak Academy of Sciences

Theorem

Let $D = (G, x, y)$ be a nilpotent regular dessin, and let $\bar{D} = (\bar{G}, \bar{x}, \bar{y})$ be its shadow dessin. If $c(G) = c \geq 2$, then $c - 1 \leq c(\bar{G}) \leq c$. Conversely, if $c(\bar{G}) = c$, then $c \leq c(G) \leq c + 1$.

Conclusion: Classification can be done in the two steps, first considering dessins without multiple edges.

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

The beggining: Abelian dessins

Theorem

Up to duality swapping the black and white vertices the abelian dessins with $Aut(D) \cong Z_{p^a} \times Z_{p^b}$, $0 \leq a \leq b$ are in 1-1 correspondence with the pairs (c, e) of integers such that

$$0 \leq c \leq b - a, \quad \text{and } e \in Z_{p^c}^*,$$

in which case $Aut(D)$ has presentation

$$\langle x, y | x^{p^b} = y^{p^{a+c}} = [x, y] = 1, y^{p^a} = x^{ep^{b-c}} \rangle.$$

Roman Nedela

Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Theorem

Up to isomorphism, the number of regular dessins A with $Aut(A) \cong Z_n \oplus Z_m$ where $0 \leq n \leq m$ is equal to $\psi(m/n)$ where ψ is the Dedekind's totient function.

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

How many abelian dessins there are?

> ### Theorem
>
> *Up to isomorphism, the number of regular dessins A with $Aut(A) \cong Z_n \oplus Z_m$ where $0 \leq n \leq m$ is equal to $\psi(m/n)$ where ψ is the Dedekind's totient function.*

Remark. The Dedekind totient function $\psi(m) = m \prod_{p|m}(1 + \frac{1}{p})$ was introduced by Dedekind in connection with his investigation of modular forms. It appears in many other contexts, for instance in the formula describing the generating function of the Riemann zeta function.

Symmetric dessins of class 2

Theorem

Simple symmetric p-dessins of class two are in correspondence with quadruples (a, b, c, u) such that

$$max(0, 1 + c - a) \le b \le c \le a \le 2c - b, u \in Z^*_{p^{a-c}}$$

in which case it has presentation

$$\langle x, y | x^{p^a} = y^{p^a} = [x, z] = [y, z] = 1, z^{up^b} = x^{-p^c} u^{p^c}, z = [x, y]\rangle$$

.

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Enumeration of simple dessins of class 2

Theorem

The number of symmetric simple dessins is given by the function

$$F(p, a) = (p + 1)(p^{a/2} - 1)/(p - 1),$$

if a is even, and

$$F(p, a) = (2p^{\frac{a+1}{2}} - p - 1)/(p - 1),$$

if a is odd.

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Further results

1. complete classification of symmetric dessins of class 2,
2. regular embeddings of $K_{n,n}^{(m)}$ over standard embedding of $K_{n,n}$,
3. regular embeddings of $K_{p^e,p^e}^{(m)}$, for a prime $p > 2$,
4. regular embeddings of $K_{2^e,2^e}^{(m)}$ incomplete.

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

Open problems

1. Labute proved a more general results on the size of Γ_n/Γ_{n+1} for the one-relator group $\langle x, y | y^p = 1 \rangle$. We have employed it just in case $p = 2$. Is there a room for generalisation?

2. It seems regular dessins with the underlying graphs $K_{n,n}^{(m)}$ play important role. Can we complete the classification?

3. A project: Groups or graphs giving rise to a unique regular dessin (map).

Roman Nedela   Matej Bel University/Math. Inst. Slovak Academy of Sciences

Abelian and nilpotent regular maps and dessins

A sample of the uniqueness phenomenon

An integer n is called singular, if $\gcd(n, \varphi(n)) = 1$.

Theorem

The graph $K_{n,n}^{(m)}$ has a unique regular embedding iff $m = 1$ and n is singular, or $m = 2$ and n is odd and singular.

This generalises an older statement on the uniqueness of regular embeddings of $K_{n,n}$ by Jones, N.,Škoviera.
